                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        bovine SE (BSE) in cattle comprises assaying sera collected from the cattle for antibodies to a species of Acinetobacter, Agrobacterium or Ruminococcus, or a peptide having a sequence present in the species which mimics a peptide of bovine myelin and identifying animals having a level of antibodies at least 2 standard deviations above that of healthy control animals. The diagnostic test kit for BSE in cattle comprises as test antigen a species of Acinetobacter, Ruminococcus or Agrobacterium or a peptide having a sequence present. In the species which mimics a peptide of bovine myelin. The methods can be used for diagnosis of demyelinating conditions such as BSE, Creuzfeld Jacob disease and multiple sclerosis.
This sequence represents a synthetic peptide epitope (#2) derived from species of Acinetobacter, which is sufficiently conformationally similar to natural Acinetobacter peptide epitopes to bind the corresponding antibodies. Acinetobacter species may be implicated in spongiform encephalopathies such as Creutzfeldt-Jakob disease or in de-myelinating diseases such as multiple sclerosis. Involvement of Acinetobacter forms the basis for a model for the development of de-myelinating diseases (an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This is a Acinetobacter calcoaceticus antigenic peptide that exhibits molecular mimicry to a bovine myelin peptide. This is used in the method and diagnostic tests for spongiform encephalopathy (SE) and other demyelinating conditions in mammals which comprises assaying antibodies present in the mammal which bind to an antigenic peptide which exhibits molecular mimicry of a mammalian myelin peptide. A method for testing for the mammalian myelin peptide.
                                                                                                                                                                                                                                                     Claim 12; Page 7; 11pp; English
                                                                                                                                                                                                                                                                                                                   Detecting de-myelinating disease or spongiform encephalopathy
                                                                                                                                                                                                                                                                                                                                                                                    WPI; 1999-571874/48
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         19-MAR-1999;

AAR61714-837 are potential peptide binders of HIA-A2.1 motif. These peptides are thus potentially immunogenic. They were predicted by using an algorithm, which assigns a score for each amino acid, at each position along a peptide. A peptide is scored in the 'Grouped Ratio' algorithm as a product of the scores of each of its residues. This peptide has an algorithm score (EO2) of -28.98. This value can then be used to predict a population of peptides with the highest occurrence of good binders. The peptides of the invention can induce cytotoxic T lymphocytes which can react with target cells. They can
                                                                                                                                                                                                                                                                                                                                             05-MAR-1993;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          each position along a peptide. A peptide is scored in the 'Grouped Ratio' algorithm as a product of the scores of each of its residues. This peptide has an algorithm (EO2) of -21.42. This value can then be used to predict a population of peptides with the highest occurrence of good binders. The peptides of the invention can induce cytotoxic T lymphocytes which can react with target cells. They can
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence

                            AAR61714-837 are potential peptide binders of HLA-A2.1 motif. These peptides are thus potentially immunogenic. They were predicted by using an algorithm, which assigns a score for each amino acid, at each position along a peptide. A peptide is scored in the 'Grouped Ratio' algorithm as a product of the scores of each of its residues. This value can then be used to predict a population of peptides with the highest occurrence of good binders. The peptides of the invention can induce cytotoxic T lymphocytes which can react with target cells. They can be used for the treatment or prophlyaxis of cancer, eg.

                                                                                                                                                                                                  MIC molecule unitarily grove, (w) presenting a mic molecule and ascertaining a first conformation score for each pocket bound peptide side-chain; (c) amending the conformation of each pocket bound peptide side-chain and ascertaining a second conformation score; (d) repeating (c) with alternative conformations of each peptide pocket bound side-chain; (e) choosing the highest conformation score for each pocket bound peptide side-chain in each binding groove pockets, and (f) combining the highest conformation score for each pocket and ascertaining a binding score for the complete peptide. The invention als provides a computer conditioned to receive information characterising a
                                                                  peptide bound to the MHC molecule and to utilise the information to predict the binding affinity of the peptide. The method can be used to identify peptides in a protein which can bind to a given MHC molecule. Such peptides can be used in the production of molecules for use in e.g vaccines, autoimmune diseases and diagnostics. Sequences AAW94957 to AAW94981 represent peptides from myelin basic protein (MBP) that can bi
                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a method for the prediction of the binding affinity of a peptide to major histocompatibility (MHC) class II molecules. The method comprises (a) ascertaining the characteristics of a MHC molecule binding groove; (b) presenting a selected peptide to the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Identifying MHC binding peptides - by ascertaining the characteristics of a MHC molecule binding groove and determining conformation scores of pocket bound peptides

                                                                                                                                                                                                        무
                                                                                                                                                                                                                                                                                                                                                sclerosis (MS). These sequences can be used in compositions for treating MS in a mammal. The composition acts to down regulate the autoimmune response, and may be administered in an amount sufficient to prevent the onset of symptoms of MS. The compositions may also be used to treat advanced stage MS, especially relapsing-remitting MS, chronic treat advanced stage MS. These peptides may also be used in the treatment of other diseases involving myelin autoantigens, including diabetes, Graves disease, myasthenia gravis, Good Pasture's syndrome, psoriasis, thyroiditis, and rheumatoid arthritis. Peptides derived from other myelin autoantigens, such as myelin oligodendrocyte protein (MGG), proteolipid protein (PLP), and myelin associated glycoprotein (MAG) can be used as alternatives to these MBP peptides in these compositions.
                                                                           AAW43951;
                                                                                                        AAW43951 standard; peptide;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    encephalomyelitis (EAE) in susceptible strains of mice. EAE is a CD4+T-cell mediated autoimmune disease which results in demyelination of the central nervous system, resulting in paralysis and other neurological abnormalities. EAE is a commonly used animal model for human multiple
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         AAR95334-R95374 represent peptides derived from myelin basic protein (MBP). Immunisation with MBP can be used to induce experimental alleencephalomyelitis (EAE) in susceptible strains of mice. EAE is a CD
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      15-MAR-1995;

The peptide of human MOG (myelin oligodendrocyte glycoprotein) and MBP can be used to treat multiple sclerosis in a mammal by down-regulating an autoimmune response in the mammal. They

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     mice. EAE is a CD4+ T-cell mediated autoimmune disease which results in demyelination of the central nervous system, resulting in paralysis and other neurological abnormalities. EAE is a commonly used animal model for human multiple sclerosis (MS). These sequences can be used in compositions for treating MS in a manmal. The composition acts to down regulate the autoimmune response, and may be administered in an amount sufficient to prevent the onset of symptoms of MS. The compositions may also be used to treat advanced stage MS, especially relapsing-remitting MS, Chronic progressive MS or benign MS. These peptides may also be used in the treatment of other diseases involving myelin autoantigens, including diabetes, Graves disease, myasthenia gravis, Good Pasture's syndrome, psoriasis, thyroiditis, and rheumatoid arthritis.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                autoimmune response, and may be administered in an amount sufficient to prevent the onset of symptoms of MS. The compositions may also be used to treat advanced stage MS, especially relapsing-remitting MS, chronic progressive MS or benign MS. These peptides may also be used in the treatment of other diseases involving myelin autoantigens, including diabetes, Graves disease, myasthenia gravis, Good Pasture's syndrome, psorlasis, thyroiditis, and rheumatoid arthritis. Peptides derived from
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            (MBP). Immunisation with MBP can be used to induce experimental allergic encephalomyelitis (EAE) in susceptible strains of mice. EAE is a CD4+ r-cell mediated autoimmune disease which results in demyelination of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              AAR95334-R95374 represent peptides derive (MBP). Immunisation with MBP can be used
                                                                                                                                                                                                                                                                                     Human; myelin oligodendrocyte glycoprotein; MOG; multiple sclerosis; autoimmune response; MBP; myelin basic protein; demyelinating.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence represents a novel peptide of human myelin basic protein (MBP). The peptide of human MOG (myelin oligodendrocyte glycoprotein) and MBP can be used to treat multiple sclerosis in a mammal by down-regulating an autoimmune response in the mammal. They can also be used to diagnose and treat other demyelinating autoimmune diseases in humans, or to prepare antibodies for the detection or diagnosis of autoimmune diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              multiple sclerosis in mammal by down-regulating auto-immune response
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Claim 101; Page 35;

                                                                          This sequence represents a fragment of the human myelin basic protein (MBP). The peptides are immunodominant regions of MBP, and are used as the immunosuppressant agents of the invention. The peptides act on the response to MBP (or tissues containing it), specifically for treatment of T cells or actively suppress these cells by inhibiting their proliferation, possibly by inducing suppressor T cells. The peptides may also be used to detect specific T cells. The MBP fragments do not induce patient developing certain malignancies), will not down regulate normal immune responses to pathogenic micro-organisms and are less toxic than drugs currently used for the treatment of MS, such as azathioprine (Imuran), and cyclosporin A.
                                                                                                                                                                                                                                                                                                                                                                                                                               28-FEB-1992;

                                                                                                                                                                                                                                                                                     Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                               neuroprotective and immunosuppressive activities. The compositions and peptides from the present invention are useful in suppressing multiple sclerosis, which is due to the induction of CD8+ suppressor T-cells. The peptides are also useful in identifying CD4+ T-cells reactive with myelin basic protein (MBP). The peptides are also useful in identifying individuals with T-cells reactive to MBP. Oral administration of MBP suppressed central nervous system (CNS) inflammation in actively induced experimental allergic encephalomyelitis (EAE). There was a decreased inflammation in both the parenchyma and meninges when cells from MBP-fed animals were transferred. This suppression was observed when CNA+ denoted but not CD8+
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New pharmaceutical composition comprising peptide fragments of myelin basic protein, useful in suppressing the symptoms of multiple sclerosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          WPI; 2000-450923/39.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; myelin basic protein; MBP; multiple sclerosis; MS; CNS; immunodominant; chronic inflammatory disease; central nervous system; autoimmune disease; neuroprotective; immunosuppressive; CD8+; CD4+.
